Network Security and Cloud Infrastructure — Revised Evidence

AutoClip | TikTok Shop Partner Security Review | 30 October 2026 | Revised evidence edition

Status: PARTIALLY VERIFIED. Application authorization controls are not equivalent to network segmentation.

Supported by repository

• Vercel hosts the web frontend; Supabase provides Auth, Postgres, Storage and Edge Functions.

• Workspace-scoped RLS policies, restricted OAuth token-table grants, server-only privileged keys and CORS origin allow-list are documented in source.

• The media route /m/:token rewrites to a Supabase Edge Function, with HMAC-signed short-lived access tokens.

• Vite dev and preview bind to 127.0.0.1; this is local development exposure reduction, not production network isolation.

Production proof required

• Capture dated Vercel production domain/HTTPS and deployment access settings; document which environments are separate.

• Capture Supabase project/environment separation, database network exposure restrictions, Storage policies and Edge Function access settings.

• Obtain applicable provider material demonstrating managed perimeter protection or workload isolation. Do not call RLS a network firewall.

Suggested questionnaire wording

• AutoClip uses managed Vercel and Supabase services with application-layer tenant isolation and restricted server credentials. Infrastructure-level segmentation and perimeter controls are managed by the providers; project-specific configurations and provider evidence are being verified.

Document control: Owner: AutoClip operator | Approval: pending | Reviewer/date: _____

Evidence rule: Only claim a control as operational after reviewing dated production or workstation evidence. Do not include secrets or personal data in screenshots.
