Endpoint Protection and Anti-Malware — Revised Evidence

AutoClip | TikTok Shop Partner Security Review | 30 October 2026 | Revised evidence edition

Status: OPEN. No active antimalware/EDR was verified by the available workstation evidence.

Supported by workstation collection

• Administrative workstation: Ubuntu 26.04.1 LTS (as recorded in the supplied Q3 evidence).

• APT daily and unattended-upgrade timers were reported enabled/active; GNOME idle lock set to 300 seconds with zero lock delay.

• The initial evidence showed pending system/kernel updates; the collection did not establish a completed patch cycle.

Operational gaps to close

• Choose and configure suitable antimalware/EDR or documented equivalent protection, verify that protection is active and updated, and retain dated status evidence. A package installation alone is insufficient.

• Apply/review pending updates and capture a fresh post-update report; record whether a reboot is required.

• Collect privileged firewall status and document exposed inbound services; perform the actual password-required-on-unlock test.

• Obtain provider security documentation for underlying Vercel/Supabase hosts; this does not replace workstation protection.

Suggested questionnaire wording

• AutoClip relies on managed cloud hosts for the Vercel and Supabase infrastructure. Administrative endpoint protection and patch management are under AutoClip responsibility. Endpoint antimalware status is not yet verified; do not claim this requirement is fully satisfied until evidence is collected.

Document control: Owner: AutoClip operator | Approval: pending | Reviewer/date: _____

Evidence rule: Only claim a control as operational after reviewing dated production or workstation evidence. Do not include secrets or personal data in screenshots.
