Q4 — Administrative Security Evidence: Status and Corrections

AutoClip | TikTok Shop Partner Security Review | 30 October 2026 | Revised evidence edition

Status: MFA settings evidenced for three named service accounts. Formal approval and remaining workstation checks are pending.

What the attached original exhibits support

• GitHub MFA, Supabase TOTP and Vercel 2FA account-level settings are shown in screenshots.

• Ubuntu GNOME idle lock and PAM password quality settings are documented from operator-provided output.

What remains unverified

• Verify that unlocking the workstation requires the account password.

• Confirm whether additional privileged administrators exist and whether MFA covers them.

• Approve password lifecycle rationale, recovery-code handling and the evidence report; enter real approver/date.

Evidence handling

• The five original pages follow unchanged. The original cover contains blank approval fields; do not treat them as completed.

Document control: Owner: AutoClip operator | Approval: pending | Reviewer/date: _____

Evidence rule: Only claim a control as operational after reviewing dated production or workstation evidence. Do not include secrets or personal data in screenshots.

AutoClip | Q4 Administrative Security Evidence

Document version: 1.0 **Evidence date:** 30 October 2026 **Status:** Prepared for formal approval
Document owner / approver: _____ **Approval date:** _____

Purpose and scope

Evidence supporting Q4 of the TikTok Shop Data Security and Privacy Review. The materials document multi-factor authentication for three identified administrative service accounts and technical workstation password and locking controls. The screenshots demonstrate account-level settings only; they do not establish organization-wide enforcement or the configuration of any other privileged accounts.

Summary of confirmed controls

Control	Evidence / verification
GitHub MFA	Authenticator app configured; passkeys shown (Exhibit A)
Supabase MFA	Microsoft Authenticator registered on 30 Oct 2026 (Exhibit B)
Vercel 2FA	Two-Factor Authentication Active; TOTP enrolled (Exhibit C)
Ubuntu screen lock	GNOME: lock-enabled=true; lock-delay=0; idle-delay=300 seconds
Ubuntu password	Account password set; pam_pwquality 1.4.5; yescrypt in PAM
Password policy	minlen=12, minclass=3, maxrepeat=3, dictcheck=1, enforcing=1
Functional tests	Weak sample rejected for length; strong sample pwscore=100
Idle locking	User reported successful automatic lock after five minutes

Limitations and pending confirmations

The password-strength tests exercise libpwquality, not the entire PAM password-change workflow. A password prompt on unlock was not separately confirmed in the provided conversation. The account has no periodic password expiration; the formal policy rationale remains to be approved. Recovery-code storage, coverage for other privileged administrators, and formal approval remain unverified. Screenshots are user-provided and do not constitute an independent platform audit.

Screenshot handling

Exhibits A–C are the supplied screenshots. A personal email address visible in Exhibit C has been redacted; other incidental account identifiers remain visible. Do not attach recovery codes, authentication secrets, or passwords.

Exhibit A — GitHub MFA

Authenticator app: Configured; passkeys: 2 configured.

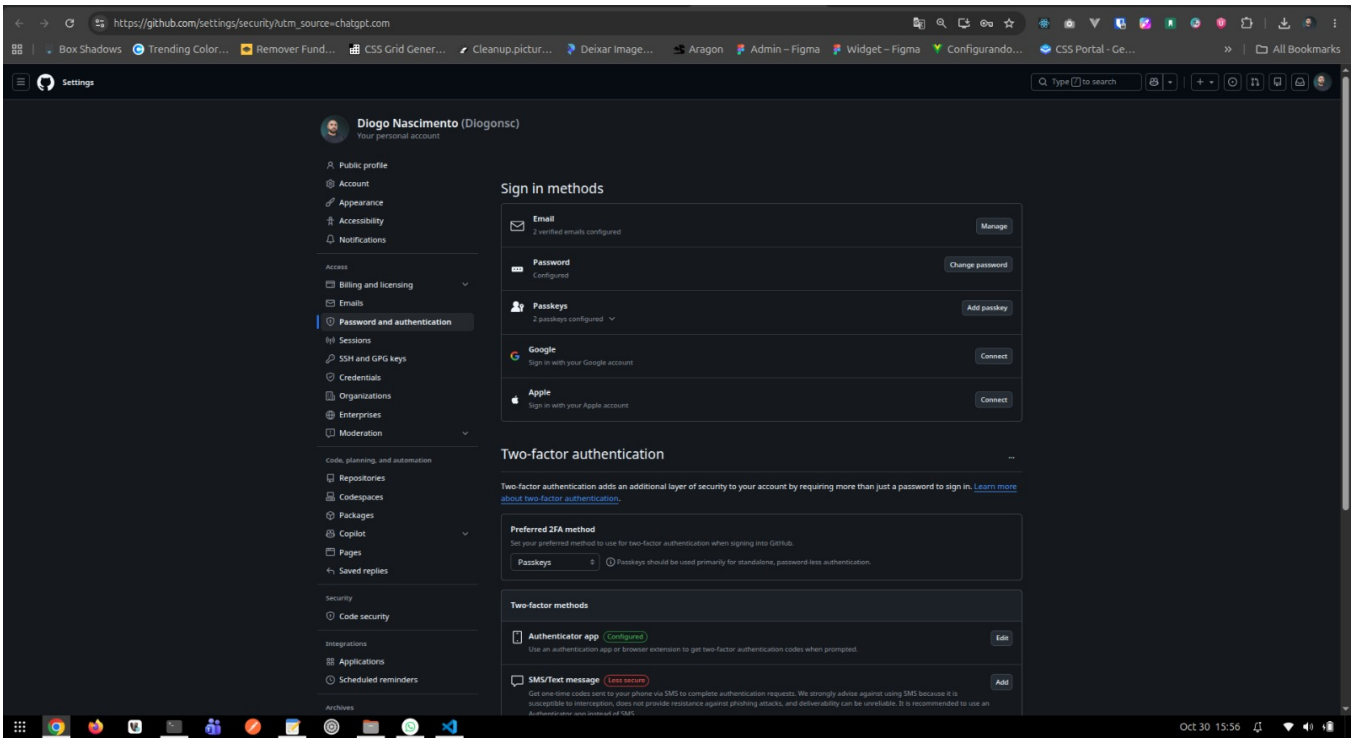

Exhibit B — Supabase MFA

Microsoft Authenticator registered; account security page.

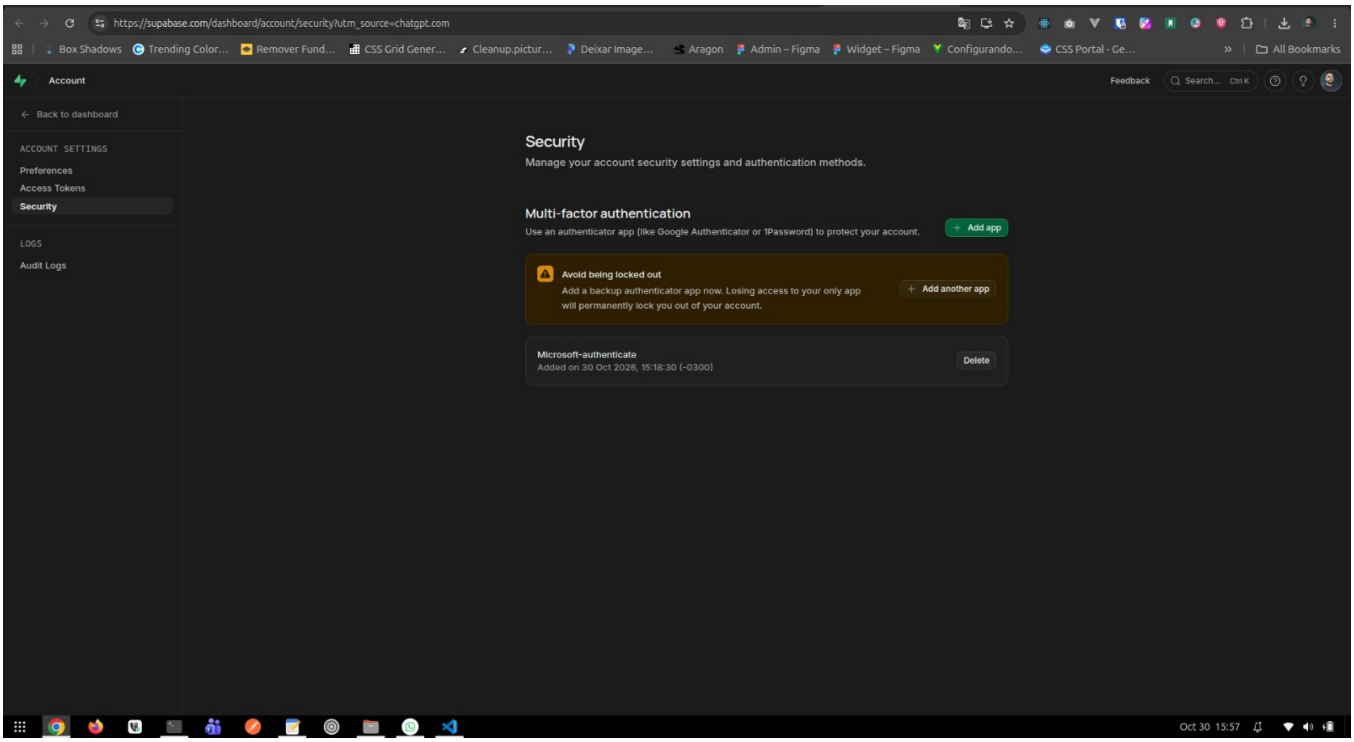

Exhibit C — Vercel 2FA

Two-Factor Authentication: Active; TOTP: Enrolled. Personal email redacted.

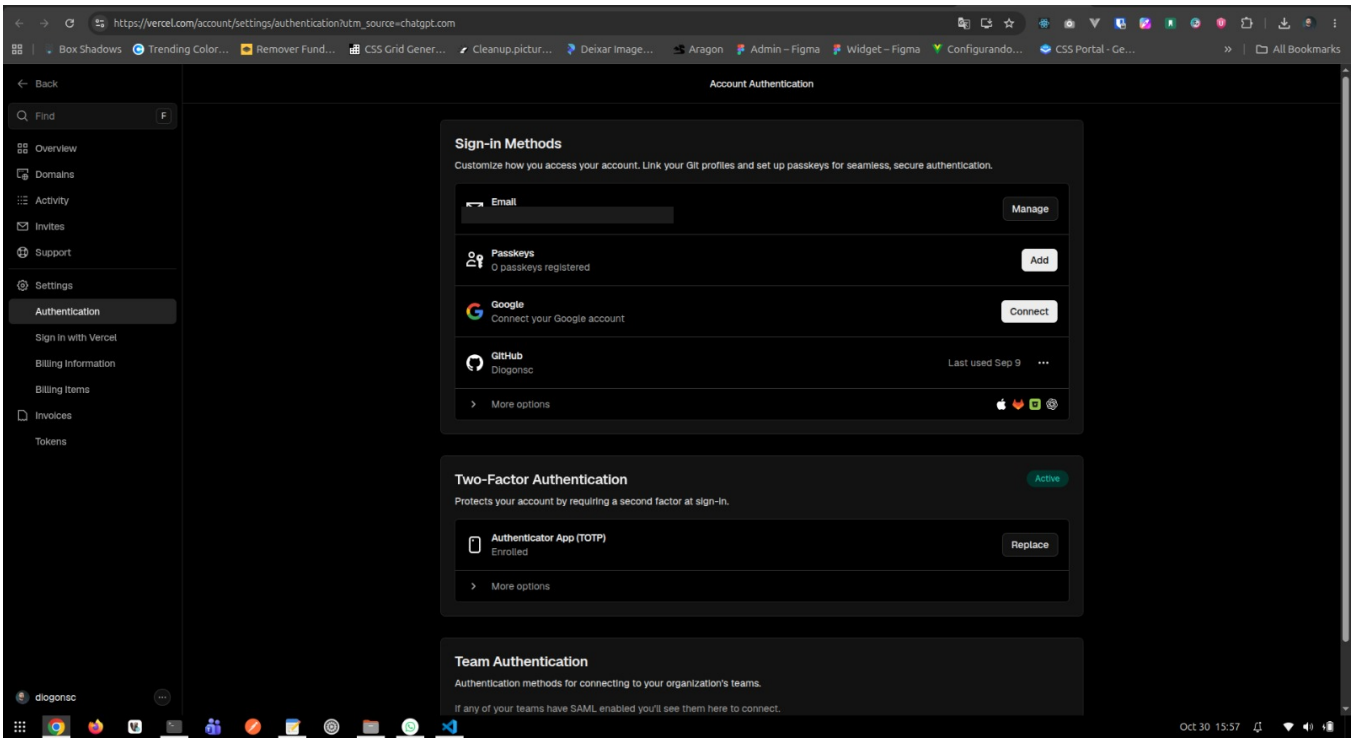

Exhibit D — Ubuntu Workstation Verification

Commands and outputs supplied by the AutoClip administrator on 30 October 2026. This is a transcription of terminal results, not an independent machine audit.

GNOME screen lock

lock-enabled = true
lock-delay = uint32 0
idle-delay = uint32 300

PAM password configuration

pam_pwquality.so retry=3
pam_unix.so obscure use_authtok try_first_pass yescrypt
libpam-pwquality = 1.4.5-5build1

Password quality configuration

minlen = 12
minclass = 3
maxrepeat = 3
dictcheck = 1
enforcing = 1

Functional password tests

Weak sample abc123: rejected as shorter than 12 characters.
Strong fictitious sample: pwscore returned 100.

Account aging

Password expires: never; maximum days between changes: 99999. Formal policy approval pending.
