Incident Response — Revised Operational Evidence

AutoClip | TikTok Shop Partner Security Review | 30 October 2026 | Revised evidence edition

Status: DOCUMENTED, NOT YET DEMONSTRATED OPERATIONAL. An approved runbook alone is insufficient.

Supported by repository

• docs/INCIDENT_RESPONSE_RUNBOOK.md defines the AutoClip Owner as Incident Lead, severity levels, containment, evidence preservation, notification assessment and post-incident review.

• The runbook specifies an access-controlled incident register and an annual tabletop exercise.

• Security contact is documented; actual monitoring and delegate coverage are not independently verified.

Operational proof required

• Approve and date the incident response policy/runbook; identify an authorized delegate and escalation route.

• Establish and demonstrate monitoring of the security mailbox and a protected incident register (including a zero-incident review if applicable).

• Conduct and record a real tabletop exercise using a fictitious compromised TikTok Shop refresh token: participants, timeline, decisions, findings, owners and completion dates.

• Verify actual backup configuration and restoration responsibility for production services; perform/document a recovery test where feasible.

Suggested questionnaire wording

• AutoClip has a written incident response runbook covering detection, containment, escalation, notification, recovery and review. Operational evidence of mailbox monitoring, exercise, backup coverage and formal approval remains outstanding.

Document control: Owner: AutoClip operator | Approval: pending | Reviewer/date: _____

Evidence rule: Only claim a control as operational after reviewing dated production or workstation evidence. Do not include secrets or personal data in screenshots.
